

# COMMON ERRORS IN ALGEBRA

GENERAL ERROR	SPECIFIC EXAMPLE OF GENERAL ERROR (LEFT SIDE    RIGHT SIDE)								
$\frac{a+bx}{a} \quad 1+bx$ <p>The correct solution is:</p> $\frac{a+bx}{a} = \frac{a}{a} + \frac{bx}{a} = \boxed{1 + \frac{bx}{a}}$ <p><i>Note: think of the correct solution as <math>\frac{1}{a}(a+bx) = \frac{1}{a}(a) + \frac{1}{a}(bx)</math>.</i>  <i>This is the Distributive Property of Mult. over Addition.</i></p>	<p style="text-align: center;"><i>Let: a=2, b=3, and x=4</i></p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center;"><math>\frac{2+3(4)}{2}</math></td> <td style="text-align: center;"><math>1+3(4)</math></td> </tr> <tr> <td style="text-align: center;"><math>\frac{2+12}{2}</math></td> <td style="text-align: center;"><math>1+12</math></td> </tr> <tr> <td style="text-align: center;"><math>\frac{14}{2}</math></td> <td style="text-align: center;"><math>13</math></td> </tr> <tr> <td style="text-align: center;"><math>7</math></td> <td style="text-align: center;"><math>13</math></td> </tr> </table>	$\frac{2+3(4)}{2}$	$1+3(4)$	$\frac{2+12}{2}$	$1+12$	$\frac{14}{2}$	$13$	$7$	$13$
$\frac{2+3(4)}{2}$	$1+3(4)$								
$\frac{2+12}{2}$	$1+12$								
$\frac{14}{2}$	$13$								
$7$	$13$								
$\frac{a}{x+y} \quad \frac{a}{x} + \frac{a}{y}$ <p>It is incorrect to separate the demoninator into two different fractions.</p> <p><i>Note: work with x+y as (x+y).</i></p>	<p style="text-align: center;"><i>Let: a=4, x=1, and y=2</i></p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center;"><math>\frac{4}{1+2}</math></td> <td style="text-align: center;"><math>\frac{4}{1} + \frac{4}{2}</math></td> </tr> <tr> <td style="text-align: center;"><math>\frac{4}{3}</math></td> <td style="text-align: center;"><math>4+2</math></td> </tr> <tr> <td style="text-align: center;"><math>\frac{4}{3}</math></td> <td style="text-align: center;"><math>6</math></td> </tr> </table>	$\frac{4}{1+2}$	$\frac{4}{1} + \frac{4}{2}$	$\frac{4}{3}$	$4+2$	$\frac{4}{3}$	$6$		
$\frac{4}{1+2}$	$\frac{4}{1} + \frac{4}{2}$								
$\frac{4}{3}$	$4+2$								
$\frac{4}{3}$	$6$								
$(x^a)^b \quad x^{a+b}$ <p><i>Note: this is a common error. Don't confuse this with the valid rule: <math>x^a \cdot x^b = x^{a+b}</math>.</i></p> <p>The equation should be:</p> $(x^a)^b = \boxed{x^{ab}}$	<p style="text-align: center;"><i>Let: x=2, a=2, and b=3</i></p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center;"><math>(2^2)^3</math></td> <td style="text-align: center;"><math>2^5</math></td> </tr> <tr> <td style="text-align: center;"><math>(4)^3</math></td> <td style="text-align: center;"><math>32</math></td> </tr> <tr> <td style="text-align: center;"><math>64</math></td> <td style="text-align: center;"><math>32</math></td> </tr> </table>	$(2^2)^3$	$2^5$	$(4)^3$	$32$	$64$	$32$		
$(2^2)^3$	$2^5$								
$(4)^3$	$32$								
$64$	$32$								
$a - b(x-1) \quad a - bx - b$ <p>Remember to use the distributive property here. The equation should be:</p> $a - b(x-1) = \boxed{a - bx + b}$ <p><i>Note: think of a - b(x-1) as a - b(x) - b(-1).</i></p>	<p style="text-align: center;"><i>Let: a=8, b=2, and x=3</i></p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center;"><math>8 - 2(3-1)</math></td> <td style="text-align: center;"><math>8 - 2(3) - 2</math></td> </tr> <tr> <td style="text-align: center;"><math>8 - 2(2)</math></td> <td style="text-align: center;"><math>8 - 6 - 2</math></td> </tr> <tr> <td style="text-align: center;"><math>8 - 4</math></td> <td style="text-align: center;"><math>2 - 2</math></td> </tr> <tr> <td style="text-align: center;"><math>4</math></td> <td style="text-align: center;"><math>0</math></td> </tr> </table>	$8 - 2(3-1)$	$8 - 2(3) - 2$	$8 - 2(2)$	$8 - 6 - 2$	$8 - 4$	$2 - 2$	$4$	$0$
$8 - 2(3-1)$	$8 - 2(3) - 2$								
$8 - 2(2)$	$8 - 6 - 2$								
$8 - 4$	$2 - 2$								
$4$	$0$								

GENERAL ERROR	SPECIFIC EXAMPLE OF GENERAL ERROR (LEFT SIDE RIGHT SIDE)
$\frac{\left(\frac{x}{a}\right)}{b} \quad \frac{bx}{a}$ <p>To divide fractions, multiply both numerator and denominator by the reciprocal of the denominator.</p> $\frac{\left(\frac{x}{a}\right)}{b} = \frac{\left(\frac{x}{a}\right) \cdot \frac{1}{b}}{\left(\frac{b}{1}\right) \cdot \frac{1}{b}} = \left(\frac{x}{a}\right) \cdot \left(\frac{1}{b}\right) = \boxed{\frac{x}{ab}}$	<p>Let: <math>x=18</math>, <math>a=3</math>, and <math>b=2</math></p> $\frac{\left(\frac{18}{3}\right)}{2} \quad \frac{2(18)}{3}$ $\frac{6}{2} \quad \frac{36}{3}$ $3 \quad 12$
$x^{-a} + x^{-b} \quad \frac{1}{x^a + x^b}$ <p>Since <math>x^{-a} = \frac{1}{x^a}</math> and <math>x^{-b} = \frac{1}{x^b}</math>, we want to rewrite each separately.</p> <p>The equation should be:</p> $x^{-a} + x^{-b} = \boxed{\frac{1}{x^a} + \frac{1}{x^b}}$	<p>Let: <math>x=2</math>, <math>a=2</math>, and <math>b=3</math></p> $2^{-2} + 2^{-3} \quad \frac{1}{2^2 + 2^3}$ $\frac{1}{2^2} + \frac{1}{2^3} \quad \frac{1}{4 + 8}$ $\frac{1}{4} + \frac{1}{8} \quad \frac{1}{12}$ $\frac{2}{8} + \frac{1}{8} \quad \frac{1}{12}$ $\frac{3}{8} \quad \frac{1}{12}$
$\sqrt{x^2 + a^2} \quad x + a$ <p>Note: don't let this get confused with <math>\sqrt{(x+a)^2} = \sqrt{(x+a)(x+a)} = x+a</math></p>	<p>Let: <math>x=3</math> and <math>a=4</math></p> $\sqrt{3^2 + 4^2} \quad 3 + 4$ $\sqrt{9 + 16} \quad 7$ $\sqrt{25} \quad 7$ $5 \quad 7$
$\sqrt{-x^2 + a^2} \quad -\sqrt{x^2 - a^2}$ <p>Note: It is not valid to factor -1 out of square roots, but it is valid to factor out <math>\sqrt{-1}</math>:</p> $\sqrt{-x^2 + a^2} = \sqrt{(-1)(x^2 - a^2)} = \sqrt{-1} \sqrt{x^2 - a^2}$ <p>(<math>\sqrt{-1} = i</math>, which is an imaginary number.)</p>	<p>Let: <math>x=5</math> and <math>a=3</math></p> $\sqrt{-5^2 + 3^2} \quad -\sqrt{5^2 - 3^2}$ $\sqrt{-25 + 9} \quad -\sqrt{25 - 9}$ $\sqrt{-16} \quad -\sqrt{16}$ <p>[not a real number]      -4</p>
